Introtek International Launches The Continuous Level Detection Sensor

Edgewood, New York – At its Edgewood, New York facility today, Introtek International has announced the introduction of the **Continuous Level Detection Sensor**.

The Continuous Level Detection Sensor, or "CLD" as it is referred to, has been recently considered by many of our clients with the intention of replacing other types of sensors that were deemed "unsatisfactory" for their applications such as load cell sensors and invasive float sensors. The CLD offers clients a non-invasive, maintenance-free method to continually and accurately monitor liquid levels in many types of containers and tanks.

"Introtek has once again delivered a product to sufficiently address the critical needs of our customers. I believe the implementation of the CLD will eliminate the guesswork and costly errors usually associated with fluid processing for many companies." said Deb Corwin, General Manager of Introtek and employee of over 20 years. *"The list of applications in which the CLD Sensor can be implemented seems to be endless. We're extremely excited about this product".*

"The truly interesting aspect of the CLD Sensor technology is that it is completely scalable to meet the demands of almost any application in just about every marketplace whether it's medical, industrial, pharmaceutical, food and beverage, you name it." stated Joe Mariano, Engineering Manager of Introtek.

Continuous Level Detection Sensor

Introtek International has been custom-designing and manufacturing non-invasive ultrasonic sensors since 1982, and has been a wholly owned subsidiary of Magnetrol since 1986. The sensors have been utilized for applications that have included the detection of air bubbles in tubing, and continuous liquid levels in containers and tanks. Introtek also offers sensors for drip chamber applications and fluidic cassettes as well as optical sensors for blood leak detection.
